

Join's Between Two Frames

```
h2o_frame.merge(other, all_x=False, all_y=False, by_x=None,  
                 by_y=None, method='auto')
```

Arguments

h2o_frame	left/self data set in the join.
other	right/other data set in the join.
all_x	If True, include all rows from the left/self frame.
all_y	If True, include all rows from the right/other frame.
by_x	list of columns in the left/self frame to use as a merge key.
by_y	list of columns in the right/other frame to use as a merge key.
method	string representing the merge method, one of auto(default), radix or hash.

Joins Between Two H2OFrames

[illegible][illegible]

```
1 census_data = census_data.merge(te_occupation, all_x = True)
```

Joins Between Two H2OFrames

```
h2o_frame.merge(other, all_x=False, all_y=False, by_x=None,  
                 by_y=None, method='auto')
```

Arguments

h2o_frame	left/self data set in the join.
other	right/other data set in the join.
all_x	If True, include all rows from the left/self frame.
all_y	If True, include all rows from the right/other frame.
by_x	list of columns in the left/self frame to use as a merge key.
by_y	list of columns in the right/other frame to use as a merge key.
method	string representing the merge method, one of auto(default), radix or hash.
